Weekly Disease Forecast No.17/2021_Mushroom Poisoning (25 April - 1 May 2021)

From the national disease surveillance system, the Department of Disease Control reveals 38 cases of mushroom poisoning with no deaths from 16 provinces during 1 January – 18 April 2021. Most patients were in the age groups 65 years and over (21.05%), 55–64 years (18.42%), and 35–44 years (18.42%).

Last week, there was a cluster of mushroom poisoning with 5 cases in Trang province in the Southern region.

According to this week disease forecast, mushroom poisoning is likely to continue sporadically as there had been rainfalls in many areas of the country which will allow more wild mushrooms to grow.

As it is very difficult to distinguish the poisonous mushrooms from the edible ones, and the poisons of some mushrooms are heat-stable that will not be destroyed despite of well cooking, the Department of Disease Control advises people to consume only grown mushrooms and avoid collecting unsure and unknown wild mushrooms which safety can not assured. In addition, it is safer to avoid eating mushrooms together with alcoholic drink as alcohol will make the poisons spread more quickly.

The common symptoms of mushroom poisoning are nausea, vomiting, abdominal pain and abdominal cramp, diarrhea, dizziness within 6 – 24 hours after mushroom consumption. After 24 hours, kidney or liver failure can be life-threatening.

In case of mushroom poisoning, first aid must be given immediately to the patients to induce vomiting by eating 3 – 4 raw egg whites or drinking 2 glasses of warm water mixed with crushed absorbent carbon tablet (activated charcoal) or 3 teaspoon of table salt. The However, this first aid is forbidden in young children under 5 years old. Giving an enema to the patients is forbidden as it might increase the risk of dehydration. Instead, an urgent visit to the nearest hospital for emergency life saving medical care is crucial. Bringing along the left over mushroom samples or foods for identification is helpful.
