Weekly Disease Forecast No.162_Mushroom Poisoning (27 May – 2 Jun 2018)

The national disease surveillance system revealed 170 cases of mushroom poisoning, of whom 1 died, during 1 January – 16 May 2018. Most patients were the 45 – 64 years age group in the Northern and the Northeastern regions of the country.

This year in May, 4 mushroom poisoning incidents with 34 cases occurred in Phitsanulok, Phetchabun, Satun and Narathiwat provinces.

According to this week disease forecast, mushroom poisoning is likely to continue as Thailand has entered the rainy season and there will be more wild mushrooms especially during May and June.

As it is very difficult to distinguish the poisonous mushrooms from the edible ones, and the poisons of some mushrooms are heat-stable that will not be destroyed despite of well cooking, the Department of Disease Control advises people to consume only grown mushrooms and avoid collecting unsure and unknown wild mushrooms which safety can not be assured. In addition, it is safer to avoid eating mushrooms together with alcoholic drink as alcohol will make the poisons spread more quickly.

The common symptoms of mushroom poisoning are nausea, vomiting, abdominal pain and abdominal cramp, diarrhea, dizziness within 6 – 24 hours after mushroom consumption. After 24 hours, kidney or liver failure can be life-threatening.

In case of mushroom poisoning, first aid must be given immediately to the patient to induce vomiting by eating 3 – 4 raw egg whites or drinking 6 -7 glasses of warm water mixed with crushed absorbent carbon tablet or salted water. An urgent visit to the nearest hospital for life saving medical care is crucial. Bringing along the left over mushroom samples or foods for identification is helpful.
